

Step 1 - Registrar searches for a domain via EPP or CoCCA web portal

Step 2 - CoCCA SRS connects to the CoCCA Blocking App over an API to see if the string requested is blocked. If yes, the registration is blocked (registrars get an EPP 2005 or 2306 Error), if not registration is permitted.

Step 3 - The CoCCA Blocking App connects to the RDAP server and reports the status (registered, reserved, or deleted).
